

Eguralt: an Interreg project on mid- and high-rise timber buildings

Funded within the framework of Interreg Sudoe, EGURALT aims to promote innovation in medium and high rise timber constructions. Xylofutur has been a partner in this project since 2020, alongside 7 other Spanish, French and Portuguese partners.

A total of 9 experiments will be conducted by the project partners, and the first results can be consulted here: <https://eguralt.eu/category/experiments/>

The project also made it possible to collect the technical characteristics of 28 wooden buildings: plans, structure, durability, etc. These sheets can be consulted freely here: <https://eguralt.eu/category/technical-datasheets/>

In parallel with these experiments, a network of wood construction professionals in Europe is being established.

Why this network?

Companies are innovating in wood construction in Europe and it can be complicated to have an overview: who are the actors, what are the innovative solutions developed in the framework of collaborative and European projects... By constituting this network and gathering on the same platform the expertise and innovative solutions available in Europe, the partners wish to facilitate access and promote wood construction.

Why joining it?

The members of this new network will be informed of the latest news of the project and invited to the events planned for the first quarter of 2023, in particular to facilitate the networking of the actors of wood construction. They will also be able to keep a European watch on current or marketed innovations in this field.

Joining this network also means strengthening its visibility in Europe.

How to join it?

Joining the EGURALT network is entirely free of charge. Simply fill in the declaration of intent and return it to Xylofutur's Europe department: service.europe@xylofutur.fr
